Forecast Discussion

High pressure will dominate the region over the next few days keeping light winds and seasonable temperatures in place. Dry conditions are also expected thru early next week as a deepening upper-level low across the Northeastern U.S. will help to stall the next storm system across the northern and central Plains. This weak cold front is expected to finally make its way across the area on Thursday of next week. This front will provide the best chance of showers and thunderstorms, a few of which may be on the strong to severe side.

Severe Weather Outlook

There is a slight risk of severe thunderstorms across the area Thursday of next week. Damaging winds and Hail appear to be the greatest threats at this time. Will continue to monitor this event and update the severe weather potential in future forecasts.
